Element Pressure Drop versus Flow Rate at 32 cSt (150 SUS)

Pressure Drop Information
Based on Flow Rate and Viscosity

$$\Delta P_{\text{filter}} = \Delta P_{\text{housing}} + (\Delta P_{\text{element}} * V_f)$$

Exercise:

Determine ΔP_{filter} at 40 gpm (151 L/min) for VF609VZ15 using 120 SUS (25.5 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 40 gpm. In this case, $\Delta P_{\text{housing}}$ is 6 psi (.42 bar) on the graph for the VF60 housing.

Use the element pressure curve to determine $\Delta P_{\text{element}}$ at 40 gpm. In this case, $\Delta P_{\text{element}}$ is 13 psi (.90 bar) according to the graph for the 9VZ1 element.

Because the viscosity in this sample is 120 SUS (25.5 cSt), we determine the **Viscosity Factor (V_f)** by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, ΔP_{filter} , is calculated by adding $\Delta P_{\text{housing}}$ with the true element pressure differential, $(\Delta P_{\text{element}} * V_f)$. The $\Delta P_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

$$\Delta P_{\text{housing}} = 6 \text{ psi} [.42 \text{ bar}] \quad | \quad \Delta P_{\text{element}} = 13 \text{ psi} [.90 \text{ bar}]$$

$$V_f = 120 \text{ SUS (25.5 cSt)} / 150 \text{ SUS (32 cSt)} = .80$$

$$\Delta P_{\text{filter}} = 6 \text{ psi} + (13 \text{ psi} * .80) = 16.4 \text{ psi}$$

OR

$$\Delta P_{\text{filter}} = .42 \text{ bar} + (.90 \text{ bar} * .80) = 1.14 \text{ bar}$$

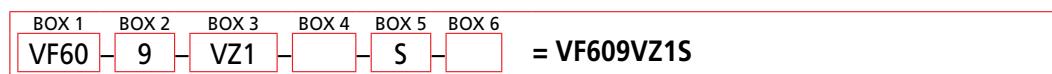

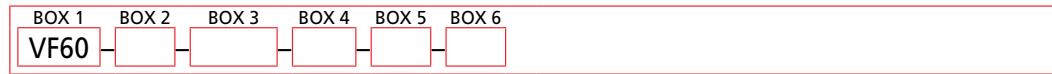

Note:
If your element is not graphed, use the following equation:

$$\Delta P_{\text{element}} = \text{Flow Rate} \times \Delta P_f$$
 Plug this variable into the overall pressure drop equation.
